

SmartVideo APX application

Real-time video, real-world impact

With the SmartVideo application and SVX video RSM, you can live stream to CommandCentral Aware and offload video to CommandCentral DEMS - all via your APX NEXT or APX N70 radio's LTE.

The challenge

In a time of increasingly rapid news cycles and complicated incidents, quick access to first-person video is no longer just a luxury - it's a necessity. From more effective response coordination through live streaming, to immediate footage upload for quicker case-building and sharing with the media, this unparalleled connectivity has transformed public safety.

But your team also spends most of their time in their community, away from reliable networks. While in-car routers can often bridge this gap, a foot chase or even standard community engagement duties can quickly leave them unaccounted for. What's more, it can be time-consuming to acquire a separate LTE contract for your body cameras in addition to other technology expenses; and yet, the need for real-time video is still non-negotiable.

The solution

SmartVideo, an APX application provides you with reliable LTE for video streaming and offload via your APX NEXT or APX N70 radio. So now, you get all the benefits of mission-critical network connectivity, from situational awareness to instant evidence access, without the need to negotiate an entirely new network contract.

Benefits

Reduce evidence backlogs and foster transparency in your community

Every day, the amount of digital evidence generated by your agency continues to increase – but your technicians’ capacity to handle it does not. This may result in burnout and low morale for your staff, and low trust from your community due to long FOIA turnaround times. Now, instant offload of priority videos over APX LTE enables technicians to start processing evidence mere minutes after it has been recorded. And when paired with powerful AI redaction and transcription tools in CommandCentral DEMS, you’ll be generating public-facing transcripts and court-ready cases more quickly than ever.

Coordinate a safer, more effective response

You need eyes on what your team is seeing at all times. Without a first-person perspective, your command center staff won’t have the context they need to take control of a rapidly-unfolding incident. SmartVideo enables you to keep track of your frontline teams effortlessly, no matter where they go, by leveraging the LTE on their APX radios for live-streaming. That means you’ll be able to see what your officers see, when they see it, and make better decisions in the moment.

Simplify your budget and procurement process

In an era of budget cuts and staffing shortages, your agency needs to do more with less - which includes acquisition and purchasing. But how can you streamline your operations without compromising key operational requirements or endangering your officers in the field? By streaming and offloading first-person video over your APX radios’ LTE, you can make the most of your existing radio and body camera investment – no new mobile carrier required. So instead of negotiating with another vendor, you can free up your time for other, more important tasks.

TECHNICAL SPECIFICATIONS	
Compatible hardware	APX NEXT APX N70 SVX video remote speaker microphone
Requirements	Radio firmware 2025.3 or higher SmartLocate CommandCentral Aware for video live-streaming CommandCentral DEMS for video upload
